Question 1

Correct

Marked out of 5.00

Write a program to find whether the given input number is Odd.

If the given number is odd, the program should return 2 else It should return 1.

Note: The number passed to the program can either be negative, positive or zero. Zero should NOT be treated as Odd.

For example:

Input	Result
123	2
456	1

Answer: (penalty regime: 0 %)

```

1 import java.util.Scanner;
2 public class Odd
3 {
4     public static void main(String[] args)
5     {
6         Scanner sc=new Scanner(System.in);
7         int n=sc.nextInt();
8         if(n%2!=0)
9         {
10             System.out.println(2);
11         }
12         else
13         {
14             System.out.println(1);
15         }
16     }
17 }
```

	Input	Expected	Got	
✓	123	2	2	✓
✓	456	1	1	✓

Question 1

Correct

Marked out of 5.00

Write a program that returns the last digit of the given number. Last digit is being referred to the least significant digit i.e. the digit in the ones (units) place in the given number.

The last digit should be returned as a positive number.

For example,

if the given number is 197, the last digit is 7

if the given number is -197, the last digit is 7

For example:

Input	Result
197	7
-197	7

Answer: (penalty regime: 0 %)

```

1 import java.util.Scanner;
2 public class lastDigit
3 {
4     public static void main(String[] args)
5     {
6         Scanner sc=new Scanner(System.in);
7         int n=sc.nextInt();
8         int a=n%10;
9         int b=Math.abs(a);
10        System.out.println(b);
11    }
12 }
```

	Input	Expected	Got	
✓	197	7	7	✓
✓	-197	7	7	✓

Passed all tests! ✓

Question 3

Correct

Marked out of 5.00

Rohit wants to add the last digits of two given numbers.

For example,

If the given numbers are 267 and 154, the output should be 11.

Below is the explanation:

Last digit of the 267 is 7

Last digit of the 154 is 4

Sum of 7 and 4 = 11

Write a program to help Rohit achieve this for any given two numbers.

Note: Tile sign of the input numbers should be ignored.

i.e.

if the input numbers are 267 and 154, the sum of last two digits should be 11

if the input numbers are 267 and -154, the sum of last two digits should be 11

if the input numbers are -267 and 154, the sum of last two digits should be 11

if the input numbers are -267 and -154, the sum of last two digits should be 11

For example:

Input	Result
267 154	11
267 -154	11
-267 154	11
-267 -154	11

Answer: (penalty regime: 0 %)

```

1 import java.util.Scanner;
2 public class Sum
3 {
4     public static void main(String[] args)
5     {
6         Scanner sc=new Scanner(System.in);
7         int a=sc.nextInt();
8         int b=sc.nextInt();
9         int c=Math.abs(a%10);
10        int d=Math.abs(b%10);
11        System.out.println(c+d);
12    }
13 }
```

	Input	Expected	Got	
✓	267 154	11	11	✓
✓	267 -154	11	11	✓
✓	-267 154	11	11	✓
✓	-267 -154	11	11	✓

Question 1

Correct

Marked out of 5.00

Consider a sequence of the form 0, 1, 1, 2, 4, 7, 13, 24, 44, 81, 149...

Write a method program which takes as parameter an integer n and prints the nth term of the above sequence. The nth term will fit in an integer value.

Example Input:

5

Output:

4

Example Input:

8

Output:

24

Example Input:

11

Output:

149

For example:

Input	Result
5	4
8	24
11	149

Answer: (penalty regime: 0 %)

```

1 import java.util.Scanner;
2 public class Pattern
3 {
4     public static void main(String[] args)
5     {
6         Scanner sc=new Scanner(System.in);
7         int n=sc.nextInt();
8         int[] arr=new int[n];
9         arr[0]=0;
10        arr[1]=1;
11        arr[2]=1;
12        for(int i=3;i<n;i++)
13        {
14            arr[i]=arr[i-1]+arr[i-2]+arr[i-3];
15        }
16        System.out.println(arr[n-1]);
17    }
18 }
```

	Input	Expected	Got

✓	11	149	149	✓

Passed all tests! ✓

Question 2

Correct

Marked out of 5.00

You have recently seen a motivational sports movie and want to start exercising regularly. Your coach tells you that it is important to get up early in the morning to exercise. She sets up a schedule for you:

On weekdays (Monday - Friday), you have to get up at 5:00. On weekends (Saturday & Sunday), you can wake up at 6:00. However, if you are on vacation, then you can get up at 7:00 on weekdays and 9:00 on weekends.

Write a program to print the time you should get up.

Input Format

Input containing an integer and a boolean value.

The integer tells you the day it is (1-Sunday, 2-Monday, 3-Tuesday, 4-Wednesday, 5-Thursday, 6-Friday, 7-Saturday). The boolean is true if you are on vacation and false if you're not on vacation.

You have to print the time you should get up.

Example Input:

1 false

Output:

6:00

Example Input:

5 false

Output:

5:00

Example Input:

1 true

Output:

9:00

For example:

Input	Result
1 false	6:00
5 false	5:00
1 true	9:00

Answer: (penalty regime: 0 %)

```

1 import java.util.Scanner;
2 public class Sports
3 {
4     public static void main(String[] main)
5     {
6         Scanner sc=new Scanner(System.in);
7         int n=sc.nextInt();
8         boolean b=sc.nextBoolean();
9         if( (n==6 || n==2 || n==3 || n==4|| n==5) && b==false )
10        {
11            System.out.println("5:00");
12        }
13        else if( (n==1 || n==7) && b==false)
14        {
15            System.out.println("6:00");
16        }
    }
}

```

```
17     else if( (n==6 || n==2 || n==3 || n==4 || n==5) && b==true)
18     {
19         System.out.println("7:00");
20     }
21     else if( (n==1 || n==7) && b==true )
22     {
23         System.out.println("9:00");
24     }
25 }
26 }
```

	Input	Expected	Got	
✓	1 false	6:00	6:00	✓
✓	5 false	5:00	5:00	✓
✓	1 true	9:00	9:00	✓

Passed all tests! ✓

Question 3

Correct

Marked out of 5.00

You and your friend are movie fans and want to predict if the movie is going to be a hit!

The movie's success formula depends on 2 parameters:

the acting power of the actor (range 0 to 10)

the critic's rating of the movie (range 0 to 10)

The movie is a hit if the acting power is excellent (more than 8) or the rating is excellent (more than 8). This holds true except if either the acting power is poor (less than 2) or rating is poor (less than 2), then the movie is a flop. Otherwise the movie is average.

Write a program that takes 2 integers:

the first integer is the acting power

second integer is the critic's rating.

You have to print Yes if the movie is a hit, Maybe if the movie is average and No if the movie is flop.

Example input:

9 5

Output:

Yes

Example input:

1 9

Output:

No

Example input:

6 4

Output:

Maybe

For example:

Input	Result
9 5	Yes
1 9	No
6 4	Maybe

Answer: (penalty regime: 0 %)

```

1 import java.util.Scanner;
2 public class Movie
3 {
4     public static void main(String[] args)
5     {
6         Scanner sc=new Scanner(System.in);
7         int acting=sc.nextInt();
8         int rating=sc.nextInt();
9         if(acting<2 || rating<2)
10        {
11            System.out.println("No");
12        }
13        else if(acting>8 || rating>8)
14        {
15            System.out.println("Yes");
}

```

```
16 }  
17 else  
18 {  
19     System.out.println("Maybe");  
20 }  
21 }  
22 }
```

	Input	Expected	Got	
✓	9 5	Yes	Yes	✓
✓	1 9	No	No	✓
✓	6 4	Maybe	Maybe	✓

Passed all tests! ✓

Question 1

Correct

Marked out of 5.00

Given an array of numbers, you are expected to return the sum of the longest sequence of POSITIVE numbers in the array.

If there are NO positive numbers in the array, you are expected to return -1.

In this question's scope, the number 0 should be considered as positive.

Note: If there are more than one group of elements in the array having the longest sequence of POSITIVE numbers, you are expected to return the total sum of all those POSITIVE numbers (see example 3 below).

input1 represents the number of elements in the array.

input2 represents the array of integers.

Example 1:

input1 = 16

input2 = {-12, -16, 12, 18, 18, 14, -4, -12, -13, 32, 34, -5, 66, 78, 78, -79}

Expected output = 62

Explanation:

The input array contains four sequences of POSITIVE numbers, i.e. "12, 18, 18, 14", "12", "32, 34", and "66, 78, 78". The first sequence "12, 18, 18, 14" is the longest of the four as it contains 4 elements. Therefore, the expected output = sum of the longest sequence of POSITIVE numbers = $12 + 18 + 18 + 14 = 63$.

Example 2:

input1 = 11

input2 = {-22, -24, 16, -1, -17, -19, -37, -25, -19, -93, -61}

Expected output = -1

Explanation:

There are NO positive numbers in the input array. Therefore, the expected output for such cases = -1.

Example 3:

input1 = 16

input2 = {-58, 32, 26, 92, -10, -4, 12, 0, 12, -2, 4, 32, -9, -7, 78, -79}

Expected output = 174

Explanation:

The input array contains four sequences of POSITIVE numbers, i.e. "32, 26, 92", "12, 0, 12", "4, 32", and "78". The first and second sequences "32, 26, 92" and "12, 0, 12" are the longest of the four as they contain 4 elements each. Therefore, the expected output = sum of the longest sequence of POSITIVE numbers = $(32 + 26 + 92) + (12 + 0 + 12) = 174$.

For example:

Input	Result
16 -12 -16 12 18 18 14 -4 -12 -13 32 34 -5 66 78 78 -79	62
11 -22 -24 -16 -1 -17 -19 -37 -25 -19 -93 -61	-1
16 -58 32 26 92 -10 -4 12 0 12 -2 4 32 -9 -7 78 -79	174

Answer: (penalty regime: 0 %)

```
1 import java.util.Scanner;
2 public class Main
3 {
```

```

4   public static void main(String[] args)
5   {
6       Scanner sc=new Scanner(System.in);
7       int n=sc.nextInt();
8       int[] arr=new int[n];
9       for(int i=0;i<n;i++)
10      {
11          arr[i]=sc.nextInt();
12
13      }
14      int maxLen=0,currentLen=0,maxSum=0;
15      int currentSum=0;
16      boolean hasPositive=false;
17      for(int i=0;i<n;i++)
18      {
19          if(arr[i]>=0)
20          {
21              hasPositive=true;
22              currentLen++;
23              currentSum+=arr[i];
24
25          }
26          else
27          {
28              if(currentLen>maxLen)
29              {
30                  maxLen=currentLen;
31                  maxSum=currentSum;
32              }
33              else if(currentLen==maxLen)
34              {
35                  maxSum+=currentSum;
36              }
37              currentLen=0;
38              currentSum=0;
39
40          }
41      }
42      if(currentLen>maxLen)
43      {
44          maxSum=currentSum;
45      }
46      else if(currentLen==maxLen)
47      {
48          maxSum+=currentSum;
49
50      }
51      if(!hasPositive)
52      {

```

	Input	Expected	Got

Passed all tests! ✓

Question 2

Correct

Marked out of 5.00

Given an integer array as input, perform the following operations on the array, in the below specified sequence.

1. Find the maximum number in the array.
2. Subtract the maximum number from each element of the array.
3. Multiply the maximum number (found in step 1) to each element of the resultant array.

After the operations are done, return the resultant array.

Example 1:

input1 = 4 (represents the number of elements in the input1 array)

input2 = {1, 5, 6, 9}

Expected Output = {-72, -36, 27, 0}

Explanation:

Step 1: The maximum number in the given array is 9.

Step 2: Subtracting the maximum number 9 from each element of the array:

$$\{(1 - 9), (5 - 9), (6 - 9), (9 - 9)\} = \{-8, -4, -3, 0\}$$

Step 3: Multiplying the maximum number 9 to each of the resultant array:

$$\{(-8 \times 9), (-4 \times 9), (3 \times 9), (0 \times 9)\} = \{-72, -36, -27, 0\}$$

So, the expected output is the resultant array {-72, -36, -27, 0}.

Example 2:

input1 = 5 (represents the number of elements in the input1 array)

input2 = {10, 87, 63, 42, 2}

Expected Output = {-6699, 0, -2088, -3915, -7395}

Explanation:

Step 1: The maximum number in the given array is 87.

Step 2: Subtracting the maximum number 87 from each element of the array:

$$\{(10 - 87), (87 - 87), (63 - 87), (42 - 87), (2 - 87)\} = \{-77, 0, -24, -45, -85\}$$

Step 3: Multiplying the maximum number 87 to each of the resultant array:

$$\{(-77 \times 87), (0 \times 87), (-24 \times 87), (-45 \times 87), (-85 \times 87)\} = \{-6699, 0, -2088, -3915, -7395\}$$

So, the expected output is the resultant array {-6699, 0, -2088, -3915, -7395}.

Example 3:

input1 = 2 (represents the number of elements in the input1 array)

input2 = {-9, 9}

Expected Output = {-162, 0}

Explanation:

Step 1: The maximum number in the given array is 9.

Step 2: Subtracting the maximum number 9 from each element of the array:

$$\{(-9 - 9), (9 - 9)\} = \{-18, 0\}$$

Step 3: Multiplying the maximum number 9 to each of the resultant array:

$$\{(-18 \times 9), (0 \times 9)\} = \{-162, 0\}$$

So, the expected output is the resultant array {-162, 0}.

Note: The input array will contain not more than 100 elements

For example:

Input	Result
4 1 5 6 9	-72 -36 -27 0
5 10 87 63 42 2	-6699 0 -2088 -3915 -7395
2 -9 9	-162 0

Answer: (penalty regime: 0 %)

```

1 import java.util.Scanner;
2 public class Main
3 {
4     public static void main(String[] args)
5     {
6         Scanner sc=new Scanner(System.in);
7         int input1=sc.nextInt();
8         int[] input2=new int[input1];
9         for(int i=0;i<input1;i++)
10        {
11            input2[i]=sc.nextInt();
12        }
13        int max=Integer.MIN_VALUE;
14        for(int i=0;i<input1;i++)
15        {
16            if(input2[i]>max)
17            {
18                max=input2[i];
19            }
20        }
21        for(int i=0;i<input1;i++)
22        {
23            input2[i]=(input2[i]-max)*max;
24        }
25        for(int i=0;i<input1;i++)
26        {
27            System.out.print(input2[i]+" ");
28        }
29    }
30 }
```

	Input	Expected	Got

Question 3

Correct

Marked out of 5.00

You are provided with a set of numbers (array of numbers).

You have to generate the sum of specific numbers based on its position in the array set provided to you.

This is explained below:

Example 1:

Let us assume the encoded set of numbers given to you is:

input1:5 and input2: {1, 51, 436, 7860, 41236}

Step 1:

Starting from the 0th index of the array pick up digits as per below:

0th index – pick up the units value of the number (in this case is 1).

1st index - pick up the tens value of the number (in this case it is 5).

2nd index - pick up the hundreds value of the number (in this case it is 4).

3rd index - pick up the thousands value of the number (in this case it is 7).

4th index - pick up the ten thousands value of the number (in this case it is 4).

(Continue this for all the elements of the input array).

The array generated from Step 1 will then be – {1, 5, 4, 7, 4}.

Step 2:

Square each number present in the array generated in Step 1.

{1, 25, 16, 49, 16}

Step 3:

Calculate the sum of all elements of the array generated in Step 2 to get the final result. The result will be = 107.

Note:

- 1) While picking up a number in Step1, if you observe that the number is smaller than the required position then use 0.
- 2) In the given function, input1[] is the array of numbers and input2 represents the number of elements in input1.

Example 2:

input1: 5 and input1: {1, 5, 423, 310, 61540}

Step 1:

Generating the new array based on position, we get the below array:

{1, 0, 4, 0, 6}

In this case, the value in input1 at index 1 and 3 is less than the value required to be picked up based on position, so we use a 0.

Step 2:

{1, 0, 16, 0, 36}

Step 3:

The final result = 53.

For example:

Input	Result
5 1 51 436 7860 41236	107
5 1 5 423 310 61540	53

Answer: (penalty regime: 0 %)

```

1 import java.util.Scanner;
2 public class Main
3 {
4     public static void main(String[] args)
5     {
6         Scanner sc=new Scanner(System.in);
7         int input1=sc.nextInt();
8         int[] input2=new int[input1];
9         for(int i=0;i<input1;i++)
10        {
11            input2[i]=sc.nextInt();
12        }
13    }
14    int[] resultArray=new int[input1];
15    for(int i=0;i<input1;i++)
16    {
17        String numStr=String.valueOf(input2[i]);
18        int position=numStr.length()-1-i;
19        if(position>=0)
20        {
21            resultArray[i]=Character.getNumericValue(numStr.charAt(position));
22        }
23        else
24        {
25            resultArray[i]=0;
26        }
27    }
28    int sum=0;
29    for(int i=0;i<input1;i++)
30    {
31        resultArray[i]*=resultArray[i];
32        sum+=resultArray[i];
33    }
34    System.out.println(sum);
35 }
36 }
```

	Input	Expected	Got	
✓	5 1 51 436 7860 41236	107	107	✓
✓	5 1 5 423 310 61540	53	53	✓

Question 1

Correct

Marked out of 5.00

Create a class called "Circle" with a radius attribute. You can access and modify this attribute using getter and setter methods. Calculate the area and circumference of the circle.

Area of Circle = πr^2

Circumference = $2\pi r$

Input:

2

Output:

Area = 12.57

Circumference = 12.57

For example:

Test	Input	Result
1	4	Area = 50.27 Circumference = 25.13

Answer: (penalty regime: 0 %)

Reset answer

```

1 import java.io.*;
2 import java.util.Scanner;
3 class Circle
4 {
5     private double radius;
6     public Circle(double radius){
7         // set the instance variable radius
8         this.radius=radius;
9     }
10    }
11    public void setRadius(double radius){
12        // set the radius
13        this.radius=radius;
14    }
15    public double getRadius()    {
16        // return the radius
17        return radius;
18    }
19    public double calculateArea() { // complete the below statement
20        return Math.PI*radius*radius;
21    }
22    public double calculateCircumference()    {
23        // complete the statement
24        return 2*Math.PI*radius;
25    }
26    }
27 }
28 class prog{
29     public static void main(String[] args)  {

Question 2

Correct

Marked out of 5.00

Create a Class Mobile with the attributes listed below,

```
private String manufacturer;
private String operating_system;
public String color;
private int cost;
```

Define a Parameterized constructor to initialize the above instance variables.

Define getter and setter methods for the attributes above.

for example : setter method for manufacturer is

```
void setManufacturer(String manufacturer){
    this.manufacturer= manufacturer;
}
```

```
String getManufacturer(){
    return manufacturer;}
```

Display the object details by overriding the `toString()` method.

For example:

Test	Result
1	manufacturer = Redmi operating_system = Andriod color = Blue cost = 34000

Answer: (penalty regime: 0 %)

```
1 class prog
2 {
3     private String manufacturer;
4     private String operating_system;
5     private String color;
6     private int cost;
7     public prog(String manufacturer, String operating_system, String color, int cost)
8     {
9         this.manufacturer= manufacturer;
10        this.operating_system= operating_system;
11        this.color= color;
12        this.cost= cost;
13    }
14    public void setManufacturer(String manufacturer)
15    {
16        this.manufacturer= manufacturer;
17    }
18    public void setOperating_system(String operating_system)
19    {
20        this.operating_system= operating_system;
21    }
22    public void setColor(String color)
23    {
24        this.color= color;
25    }
26    public void setCost(int cost)
27    {
28        this.cost= cost;
29    }
30    public String getManufacturer()
31    {
32        return manufacturer;
33    }
34}
```

```
34     }
35     public String getOperating_system()
36     {
37         return operating_system;
38     }
39     public String getColor()
40     {
41         return color;
42     }
43     public int getCost()
44     {
45         return cost;
46     }
47     public String toString()
48     {
49         return "manufacturer = "+manufacturer+"\n"+
50             "operating_system = "+operating_system+"\n"+
51             "color = "+color+"\n"+
52             "cost = "+cost;
53     }
54 }
```

	Test	Expected	Got	
✓	1	manufacturer = Redmi operating_system = Andriod color = Blue cost = 34000	manufacturer = Redmi operating_system = Andriod color = Blue cost = 34000	✓

Question 1

Correct

Marked out of 5.00

Create a class known as "BankAccount" with methods called deposit() and withdraw().

Create a subclass called SavingsAccount that overrides the withdraw() method to prevent withdrawals if the account balance falls below one hundred.

For example:

Result

```
Create a Bank Account object (A/c No. BA1234) with initial balance of $500:  
Deposit $1000 into account BA1234:  
New balance after depositing $1000: $1500.0  
Withdraw $600 from account BA1234:  
New balance after withdrawing $600: $900.0  
Create a SavingsAccount object (A/c No. SA1000) with initial balance of $300:  
Try to withdraw $250 from SA1000!  
Minimum balance of $100 required!  
Balance after trying to withdraw $250: $300.0
```

Answer: (penalty regime: 0 %)

[Reset answer](#)

```
1 class BankAccount {  
2     // Private field to store the account number  
3     private String accountNumber;  
4  
5     // Private field to store the balance  
6     private double balance;  
7  
8     // Constructor to initialize account number and balance  
9     BankAccount(String ac, double bal){  
10         accountNumber = ac;  
11         balance = bal;  
12     }  
13     // Method to deposit an amount into the account  
14     public void deposit(double amount) {  
15         // Increase the balance by the deposit amount  
16         balance += amount;  
17     }  
18  
19     // Method to withdraw an amount from the account  
20     public void withdraw(double amount) {  
21         // Check if the balance is sufficient for the withdrawal  
22         if (balance >= amount) {  
23             // Decrease the balance by the withdrawal amount  
24             balance -= amount;  
25         } else {  
26             // Print a message if the balance is insufficient  
27             System.out.println("Insufficient balance");  
28         }  
29     }  
30  
31     // Method to get the current balance  
32     public double getBalance() {  
33         // Return the current balance  
34         return balance;  
35     }  
36  
37 }  
38  
39  
40 class SavingsAccount extends BankAccount {  
41     // Constructor to initialize account number and balance  
42     public SavingsAccount(String accountNumber, double balance) {
```

```

43     // Call the parent class constructor
44     super(accountNumber,balance);
45 }
46 // Override the withdraw method from the parent class
47 @Override
48 public void withdraw(double amount) {
49     // Check if the withdrawal would cause the balance to drop below $100
50     if (getBalance() - amount < 100) {
51         // Print a message if the minimum balance requirement is not met
52         System.out.println("Minimum balance of $100 required!");

```

Question 2

Correct

Marked out of 5.00

create a class called College with attribute String name, constructor to initialize the name attribute , a method called Admitted(). Create a subclass called CSE that extends Student class, with department attribute , Course() method to sub class. Print the details of the Student.

College:

```
String collegeName;
public College() {}
public admitted() {}
```

Student:

```
String studentName;
String department;
public Student(String collegeName, String studentName, String depart) {}
public toString()
```

Expected Output:

A student admitted in REC

CollegeName : REC

StudentName : Venkatesh

Department : CSE

For example:

Result
A student admitted in REC CollegeName : REC StudentName : Venkatesh Department : CSE

Answer: (penalty regime: 0 %)

```
1 class College
2 {
3     protected String collegeName;
4
5     public College(String collegeName) {
6         // initialize the instance variables
7         this.collegeName = collegeName;
8
9     }
10
11    public void admitted() {
12        System.out.println("A student admitted in "+collegeName);
13    }

Is Palindrome Number? ►

Question 1

Correct

Marked out of 5.00

Given a String input1, which contains many number of words separated by : and each word contains exactly two lower case alphabets, generate an output based upon the below 2 cases.

Note:

1. All the characters in input 1 are lowercase alphabets.
2. input 1 will always contain more than one word separated by :
3. Output should be returned in uppercase.

Case 1:

Check whether the two alphabets are same.

If yes, then take one alphabet from it and add it to the output.

Example 1:

input1 = ww:ii:pp:rr:oo

output = WIPRO

Explanation:

word1 is ww, both are same hence take w

word2 is ii, both are same hence take i

word3 is pp, both are same hence take p

word4 is rr, both are same hence take r

word5 is oo, both are same hence take o

Hence the output is WIPRO

Case 2:

If the two alphabets are not same, then find the position value of them and find maximum value – minimum value.

Take the alphabet which comes at this (maximum value - minimum value) position in the alphabet series.

Example 2"

input1 = zx:za:ee

output = BYE

Explanation

word1 is zx, both are not same alphabets

position value of z is 26

position value of x is 24

max – min will be $26 - 24 = 2$

Alphabet which comes in 2nd position is b

Word2 is za, both are not same alphabets

position value of z is 26

position value of a is 1

max – min will be $26 - 1 = 25$

Alphabet which comes in 25th position is y

word3 is ee, both are same hence take e

Hence the output is BYE

For example:

Input	Result
ww:ii:pp:rr:oo	WIPRO
zx:za:ee	BYE

Answer: (penalty regime: 0 %)

```

1 import java.util.Scanner;
2
3 public class WordProcessor {
4     public static void main(String[] args) {
5         Scanner scanner = new Scanner(System.in);
6         String input = scanner.nextLine();
7         String[] words = input.split(":");
8
9         StringBuilder output = new StringBuilder();
10
11        for (String word : words) {
12            if (word.length() == 2) {
13                char firstChar = word.charAt(0);
14                char secondChar = word.charAt(1);
15
16                if (firstChar == secondChar) {
17                    output.append(firstChar);
18                } else {
19                    int position1 = firstChar - 'a' + 1;
20                    int position2 = secondChar - 'a' + 1;
21                    int maxPos = Math.max(position1, position2);
22                    int minPos = Math.min(position1, position2);
23                    int newPos = maxPos - minPos;
24                    char newChar = (char) ('a' + newPos - 1);
25                    output.append(newChar);
26                }
27            }
28        }
29        System.out.println(output.toString().toUpperCase());
30
31        scanner.close();
32    }
33 }

Passed all tests! ✓

Question 2

Correct

Marked out of 5.00

You are provided a string of words and a 2-digit number. The two digits of the number represent the two words that are to be processed.

For example:

If the string is "Today is a Nice Day" and the 2-digit number is 41, then you are expected to process the 4th word ("Nice") and the 1st word ("Today").

The processing of each word is to be done as follows:

Extract the Middle-to-Begin part: Starting from the middle of the word, extract the characters till the beginning of the word.

Extract the Middle-to-End part: Starting from the middle of the word, extract the characters till the end of the word.

If the word to be processed is "Nice":

Its Middle-to-Begin part will be "iN".

Its Middle-to-End part will be "ce".

So, merged together these two parts would form "iNce".

Similarly, if the word to be processed is "Today":

Its Middle-to-Begin part will be "doT".

Its Middle-to-End part will be "day".

So, merged together these two parts would form "doTday".

Note: Note that the middle letter 'd' is part of both the extracted parts. So, for words whose length is odd, the middle letter should be included in both the extracted parts.

Expected output:

The expected output is a string containing both the processed words separated by a space "iNce doTday"

Example 1:

input1 = "Today is a Nice Day"

input2 = 41

output = "iNce doTday"

Example 2:

input1 = "Fruits like Mango and Apple are common but Grapes are rare"

input2 = 39

output = "naMngo arGpes"

Note: The input string input1 will contain only alphabets and a single space character separating each word in the string.

Note: The input string input1 will NOT contain any other special characters.

Note: The input number input2 will always be a 2-digit number ($>=11$ and $<=99$). One of its digits will never be 0. Both the digits of the number will always point to a valid word in the input1 string.

For example:

Input	Result
Today is a Nice Day 41	iNce doTday
Fruits like Mango and Apple are common but Grapes are rare 39	naMngo arGpes

Answer: (penalty regime: 0 %)

```
1 import java.util.Scanner;
2
3 public class WordProcessor {
```

```

4  public static void main(String[] args) {
5      Scanner scanner = new Scanner(System.in);
6      String inputString = scanner.nextLine();
7      int inputNumber = scanner.nextInt();
8
9      String processedString = processWords(inputString, inputNumber);
10     System.out.println(processedString);
11 }
12
13 public static String processWords(String inputString, int inputNumber) {
14     String[] words = inputString.split(" ");
15
16     if (words.length < 2 || inputNumber < 11 || inputNumber > 99) {
17         return "Invalid input";
18     }
19
20     int word1Index = inputNumber / 10 - 1;
21     int word2Index = inputNumber % 10 - 1;
22
23     if (word1Index >= words.length || word2Index >= words.length) {
24         return "Invalid word indices";
25     }
26
27     String word1 = words[word1Index];
28     String word2 = words[word2Index];
29
30     String processedWord1 = processWord(word1);
31     String processedWord2 = processWord(word2);
32
33     return processedWord1 + " " + processedWord2;
34 }
35
36 public static String processWord(String word) {
37     int middleIndex = word.length() / 2;
38     StringBuilder input = new StringBuilder();
39     StringBuilder input1 = new StringBuilder();
40     input.append(word.substring(0,middleIndex+1));
41     input1.append(word.substring(0,middleIndex));
42     if(word.length()%2==0){
43         return input1.reverse()+word.substring(middleIndex);
44     }
45     else{
46         return input.reverse()+word.substring(middleIndex);
47     }
48 }
49 }
```

	Input	Expected	Got

Question 3

Correct

Marked out of 5.00

Given 2 strings input1 & input2.

- Concatenate both the strings.
- Remove duplicate alphabets & white spaces.
- Arrange the alphabets in descending order.

Assumption 1:

There will either be alphabets, white spaces or null in both the inputs.

Assumption 2:

Both inputs will be in lower case.

Example 1:

Input 1: apple

Input 2: orange

Output: rponlgea

Example 2:

Input 1: fruits

Input 2: are good

Output: utsroigfeda

Example 3:

Input 1: ""

Input 2: ""

Output: null

For example:

Test	Input	Result
1	apple orange	rponlgea
2	fruits are good	utsroigfeda

Answer: (penalty regime: 0 %)

```

1 import java.util.HashSet;
2 import java.util.Scanner;
3 import java.util.Set;
4 import java.util.stream.Collectors;
5
6 public class StringProcessor {
7     public static void main(String[] args) {
8         Scanner scanner = new Scanner(System.in);
9         String input1 = scanner.nextLine();
10        String input2 = scanner.nextLine();
11        String result = processStrings(input1, input2);
12        System.out.println(result);
13    }
14    public static String processStrings(String input1, String input2) {
15        if ((input1 == null || input1.trim().isEmpty()) && (input2 == null || input2.trim().isEmpty())) {
16            return "null";
17        }
18        String concatenated = input1 + input2;
19        Set<Character> uniqueChars = new HashSet<>();
20        for (char c : concatenated.toCharArray()) {

```

```
21     if (c != ' ') {  
22         uniqueChars.add(c);  
23     }  
24     String sortedChars = uniqueChars.stream().map(String::valueOf).sorted((a, b) -> b.compareTo(a)).collect(Co  
25     return sortedChars;  
26 }  
27  
28 }  
29 }
```

	Test	Input	Expected	Got	
✓	1	apple orange	rponlgea	rponlgea	✓
✓	2	fruits are good	utsroigfeda	utsroigfeda	✓
✓	3		null	null	✓

Question 1

Correct

Marked out of 5.00

RBI issues all national banks to collect interest on all customer loans.

Create an RBI interface with a variable String parentBank="RBI" and abstract method rateOfInterest().

RBI interface has two more methods default and static method.

```
default void policyNote() {
    System.out.println("RBI has a new Policy issued in 2023.");
}

static void regulations(){
    System.out.println("RBI has updated new regulations on 2024.");
}
```

Create two subclasses SBI and Karur which implements the RBI interface.

Provide the necessary code for the abstract method in two sub-classes.

Sample Input/Output:

RBI has a new Policy issued in 2023
RBI has updated new regulations in 2024.
SBI rate of interest: 7.6 per annum.
Karur rate of interest: 7.4 per annum.

For example:

Test	Result
1	RBI has a new Policy issued in 2023 RBI has updated new regulations in 2024. SBI rate of interest: 7.6 per annum. Karur rate of interest: 7.4 per annum.

Answer: (penalty regime: 0 %)

```
1 interface RBI {
2     String parentBank = "RBI";
3     double rateOfInterest();
4     default void policyNote() {
5         System.out.println(parentBank + " has a new Policy issued in 2023");
6     }
7     static void regulations() {
8         System.out.println(parentBank + " has updated new regulations in 2024.");
9     }
10 }
11 class SBI implements RBI {
12     @Override
13     public double rateOfInterest() {
14         return 7.6;
15     }
16 }
17 class Karur implements RBI {
18     @Override
19     public double rateOfInterest() {
20         return 7.4;
21     }
22 }
23 public class BankPolicies {
24     public static void main(String[] args) {
25         RBI sbi = new SBI();
26         RBI karur = new Karur();
27         sbi.policyNote();
28         RBI.regulations();
29         System.out.println("SBI rate of interest: " + sbi.rateOfInterest() + " per annum.");
30     }
31 }
```

```
30 }     System.out.println("Karur rate of interest: " + karur.rateOfInterest() + " per annum.");
31 }
32 }
```

	Test	Expected	Got	
✓	1	RBI has a new Policy issued in 2023 RBI has updated new regulations in 2024. SBI rate of interest: 7.6 per annum. Karur rate of interest: 7.4 per annum.	RBI has a new Policy issued in 2023 RBI has updated new regulations in 2024. SBI rate of interest: 7.6 per annum. Karur rate of interest: 7.4 per annum.	✓

Question 2

Correct

Marked out of 5.00

create an interface Playable with a method play() that takes no arguments and returns void. Create three classes Football, Volleyball, and Basketball that implement the Playable interface and override the play() method to play the respective sports.

```
interface Playable {
    void play();
}

class Football implements Playable {
    String name;
    public Football(String name){
        this.name=name;
    }
    public void play() {
        System.out.println(name+" is Playing football");
    }
}
```

Similarly, create Volleyball and Basketball classes.

Sample output:

```
Sadhvin is Playing football
Sanjay is Playing volleyball
Sruthi is Playing basketball
```

For example:

Test	Input	Result
1	Sadhvin Sanjay Sruthi	Sadhvin is Playing football Playing volleyball Playing basketball
2	Vijay Arun Balaji	Vijay is Playing football Arun is Playing volleyball Balaji is Playing basketball

Answer: (penalty regime: 0 %)

```
1 ↓ import java.util.Scanner;
2 ↓ interface Playable {
3     void play();
4 }
5 ↓ class Football implements Playable {
6     String name;
7
8 ↓     public Football(String name) {
9         this.name = name;
10    }
11
12    @Override
13 ↓     public void play() {
14         System.out.println(name + " is Playing football");
15    }
16 }
17
18 ↓ class Volleyball implements Playable {
19     String name;
20
21 ↓     public Volleyball(String name) {
22         this.name = name;
23     }
24    @Override
25 ↓     public void play() {
26         System.out.println(name + " is Playing volleyball");
27    }
28 }
```

```

26     }
27 }
28 }
29 class Basketball implements Playable {
30     String name;
31
32 public Basketball(String name) {
33     this.name = name;
34 }
35
36 @Override
37 public void play() {
38     System.out.println(name + " is Playing basketball");
39 }
40 }
41 public class SportsGame {
42 public static void main(String[] args) {
43     Scanner scanner = new Scanner(System.in);
44     Playable[] players = new Playable[3];
45     String[] sports = {"Football", "Volleyball", "Basketball"};
46     for (int i = 0; i < players.length; i++) {
47         String name = scanner.nextLine();
48         switch (sports[i]) {
49             case "Football":
50                 players[i] = new Football(name);
51                 break;
52             case "Volleyball":

```

	Test	Input	Expected	Got	
✓	1	Sadhvin Sanjay Sruthi	Sadhvin is Playing football Playing volleyball Playing basketball	Sadhvin is Playing football Playing volleyball Playing basketball	✓
✓	2	Vijay Arun Balaji	Vijay is Playing football Arun is Playing volleyball Balaji is Playing basketball	Vijay is Playing football Arun is Playing volleyball Balaji is Playing basketball	✓

Question 3

Correct

Marked out of 5.00

Create interfaces shown below.

```
interface Sports {
    public void setHomeTeam(String name);
    public void setVisitingTeam(String name);
}
```

```
interface Football extends Sports {
    public void homeTeamScored(int points);
    public void visitingTeamScored(int points);}
```

create a class College that implements the Football interface and provides the necessary functionality to the abstract methods.

sample Input:

Rajalakshmi

Saveetha

22

Output:

Rajalakshmi 22 scored

Saveetha 21 scored

Rajalakshmi is the Winner!

For example:

Test	Input	Result
1	Rajalakshmi Saveetha 22 21	Rajalakshmi 22 scored Saveetha 21 scored Rajalakshmi is the winner!

Answer: (penalty regime: 0 %)

Question 1

Correct

Marked out of 5.00

1. Final Variable:

- Once a variable is declared `final`, its value cannot be changed after it is initialized.
- It must be initialized when it is declared or in the constructor if it's not initialized at declaration.
- It can be used to define constants

```
final int MAX_SPEED = 120; // Constant value, cannot be changed
```

2. Final Method:

- A method declared `final` cannot be overridden by subclasses.
- It is used to prevent modification of the method's behavior in derived classes.

```
public final void display() {
    System.out.println("This is a final method.");
}
```

3. Final Class:

- A class declared as `final` cannot be subclassed (i.e., no other class can inherit from it).
- It is used to prevent a class from being extended and modified.
- `public final class Vehicle {
 // class code
}`

Given a Java Program that contains the bug in it, your task is to clear the bug to the output.

you should delete any piece of code.

For example:

Test	Result
1	The maximum speed is: 120 km/h This is a subclass of FinalExample.

Answer: (penalty regime: 0 %)

[Reset answer](#)

```
1 class FinalExample {
2
3     // Final variable
4     final int maxSpeed = 120;
5
6     // Final method
7     public final void displayMaxSpeed() {
8         System.out.println("The maximum speed is: " + maxSpeed + " km/h");
9     }
10 }
11
12 class SubClass extends FinalExample {
13
14     // public void displayMaxSpeed() {
15     //     System.out.println("Cannot override a final method");
16     // }
17
18     // You can create new methods here
19     public void showDetails() {
20         System.out.println("This is a subclass of FinalExample.");
21     }
22 }
23
24 class prog {
```

```
25 public static void main(String[] args) {  
26     FinalExample obj = new FinalExample();  
27     obj.displayMaxSpeed();  
28  
29     SubClass subObj = new SubClass();  
30     subObj.showDetails();  
31 }  
32 }
```

	Test	Expected	Got

Question 2

Correct

Marked out of 5.00

Create a base class Shape with a method called calculateArea(). Create three subclasses: Circle, Rectangle, and Triangle. Override the calculateArea() method in each subclass to calculate and return the shape's area.

In the given exercise, here is a simple diagram illustrating polymorphism implementation:

```
abstract class Shape {
    public abstract double calculateArea();
}
```

System.out.printf("Area of a Triangle :%.2f%n",((0.5)*base*height)); // use this statement

sample Input :

```
4 // radius of the circle to calculate area PI*r*r
5 // length of the rectangle
6 // breadth of the rectangle to calculate the area of a rectangle
4 // base of the triangle
3 // height of the triangle
```

OUTPUT:

Area of a circle :50.27
Area of a Rectangle :30.00
Area of a Triangle :6.00

For example:

Test	Input	Result
1	4 5 6 4 3	Area of a circle: 50.27 Area of a Rectangle: 30.00 Area of a Triangle: 6.00
2	7 4.5 6.5 2.4 3.6	Area of a circle: 153.94 Area of a Rectangle: 29.25 Area of a Triangle: 4.32

Answer: (penalty regime: 0 %)

```
1 import java.util.*;
2 abstract class Shape{
3     abstract void calculatearea();
4 }
5 class Circle extends Shape{
```

```

6   float rad;

Question 3

Correct

Marked out of 5.00

As a logic building learner you are given the task to extract the string which has vowel as the first and last characters from the given array of Strings.

Step1: Scan through the array of Strings, extract the Strings with first andlast characters as vowels; these strings should be concatenated.

Step2: Convert the concatenated string to lowercase and return it.

If none of the strings in the array has first and last character as vowel, then return no matches found

input1: an integer representing the number of elements in the array.

input2: String array.

Example 1:

input1: 3

input2: {"oreo", "sirish", "apple"}

output: oreoapple

Example 2:

input1: 2

input2: {"Mango", "banana"}

output: no matches found

Explanation:

None of the strings has first andlast character as vowel.

Hence the output is no matches found.

Example 3:

input1: 3

input2: {"Ate", "Ace", "Girl"}

output: ateace

For example:

Input	Result
3 oreo sirish apple	oreoapple
2 Mango banana	no matches found
3 Ate Ace Girl	ateace

Answer: (penalty regime: 0 %)

```

1 import java.util.*;
2 class prog{
3     public static void main(String ae[]){
4         Scanner scan = new Scanner(System.in);
5         int n = scan.nextInt();
6         String arr[] = new String[n];
7         scan.nextLine();
8         String str = scan.nextLine();
9         String temp = "";
10        int j=0;
11        int l=str.length();

```

```

12   for(int i = 0;i<1;i++){
13     if(str.charAt(i)==' '){
14       arr[j] = temp;
15       temp ="";

Question 1

Correct

Marked out of 5.00

Write a Java program to handle `ArithmaticException` and `ArrayIndexOutOfBoundsException`.

Create an array, read the input from the user, and store it in the array.

Divide the 0th index element by the 1st index element and store it.

If the 1st element is zero, it will throw an exception.

If you try to access an element beyond the array limit throws an exception.

Input:

5

10 0 20 30 40

Output:**java.lang.ArithmaticException: / by zero****I am always executed**

Input:

3

10 20 30

Output

java.lang.ArrayIndexOutOfBoundsException: Index 3 out of bounds for length 3

I am always executed

For example:

Test	Input	Result
1	6 1 0 4 1 2 8	java.lang.ArithmaticException: / by zero I am always executed

Answer: (penalty regime: 0 %)

```

1 import java.util.Scanner;
2 public class Main
3 {
4     public static void main(String[] args)
5     {
6         Scanner sc=new Scanner(System.in);
7         int n=sc.nextInt();
8         int[] arr=new int[n];
9         for(int i=0;i<n;i++)
10        {
11            arr[i]=sc.nextInt();
12        }
13        try
14        {
15            int a=arr[0]/arr[1];
16            int b=arr[n];
17        }
18        catch(ArithmaticException ae)
19        {
20            System.out.println(ae.toString());
21        }
22        catch(ArrayIndexOutOfBoundsException e)
23        {
24            System.out.println(e.toString());
25        }
26        finally
27        {
28            System.out.println("I am always executed");
29        }
}

```

```
30  
31 }  
32 }
```

	Test	Input	Expected	Got

Question 2

Correct

Marked out of 5.00

Write a Java program to create a method that takes an integer as a parameter

and throws an exception if the number is odd.

Sample input and Output:

```
82 is even.  
Error: 37 is odd.
```

Fill the preloaded answer to get the expected output.

For example:**Result**

```
82 is even.  
Error: 37 is odd.
```

Answer: (penalty regime: 0 %)

[Reset answer](#)

```
1 v class prog {  
2 v   public static void main(String[] args) {  
3 v     int n = 82;  
4 v     trynumber(n);  
5 v     n = 37;  
6 v     // call the trynumber(n);  
7 v     trynumber(n);  
8 v   }  
9 v  
10 v }  
11 v  
12 v   public static void trynumber(int n) {  
13 v     try {  
14 v       //call the checkEvenNumber()  
15 v       checkEvenNumber(n);  
16 v       System.out.println(n + " is even.");  
17 v     } catch (Exception e) {  
18 v       System.out.println("Error: " + e.getMessage());  
19 v     }  
20 v   }  
21 v  
22 v   public static void checkEvenNumber(int number) throws Exception {  
23 v     if (number % 2 != 0) {  
24 v       throw new Exception(number+" is odd.");  
25 v     }  
26 v   }  
27 v }  
28 }
```

	Expected	Got	
✓	82 is even. Error: 37 is odd.	82 is even. Error: 37 is odd.	✓

Passed all tests! ✓

Question 3

Correct

Marked out of 5.00

In the following program, an array of integer data is to be initialized.

During the initialization, if a user enters a value other than an integer, it will throw an InputMismatchException exception.

On the occurrence of such an exception, your program should print "You entered bad data."

If there is no such exception it will print the total sum of the array.

```
/* Define try-catch block to save user input in the array "name"
```

```
If there is an exception then catch the exception otherwise print the total sum of the array. */
```

Sample Input:

```
3
5 2 1
```

Sample Output:

```
8
```

Sample Input:

```
2
1 g
```

Sample Output:

```
You entered bad data.
```

For example:

Input	Result
3 5 2 1	8
2 1 g	You entered bad data

Answer: (penalty regime: 0 %)

```

1 import java.util.Scanner;
2 import java.util.InputMismatchException;
3 class prog {
4     public static void main(String[] args) {
5         Scanner sc = new Scanner(System.in);
6         int length = sc.nextInt();
7         // create an array to save user input
8         int[] name = new int[length];
9         int sum=0;//save the total sum of the array.
10
11
12     /* Define try-catch block to save user input in the array "name"
13     If there is an exception then catch the exception otherwise print
14     the total sum of the array. */
15     try
16     {
17         for(int i=0;i<length;i++)
18         {
19             name[i]=sc.nextInt();
20             sum+=name[i];
21
22         }
23         System.out.println(sum);
24
25     }
26     catch(InputMismatchException ae )

```

```
27  {
28      System.out.println("You entered bad data.");
29  }
30
31
32
33
34
35
36
37  }
38 }
```

	Input	Expected	Got

Question 1

Correct

Marked out of 1.00

Given an ArrayList, the task is to get the first and last element of the ArrayList in Java.

```
Input: ArrayList = [1, 2, 3, 4]
Output: First = 1, Last = 4
```

```
Input: ArrayList = [12, 23, 34, 45, 57, 67, 89]
Output: First = 12, Last = 89
```

Approach:

1. Get the ArrayList with elements.
2. Get the first element of ArrayList using the get(index) method by passing index = 0.
3. Get the last element of ArrayList using the get(index) method by passing index = size - 1.

Answer: (penalty regime: 0 %)

```
1 import java.util.*;
2 public class Solution
3 {
4     public static void main(String[] args)
5     {
6         Scanner sc=new Scanner(System.in);
7         int n=sc.nextInt();
8         ArrayList<Integer> arr=new ArrayList<Integer>(n);
9         while(sc.hasNextInt())
10        {
11             int a=sc.nextInt();
12             arr.add(a);
13         }
14
15         int b=arr.size()-1;
16         System.out.println("ArrayList: "+arr);
17         System.out.println("First : "+arr.get(0)+" , Last : "+arr.get(b));
18     }
19 }
```

	Test	Input	Expected	Got	
✓	1	6 30 20 40 50 10 80	ArrayList: [30, 20, 40, 50, 10, 80] First : 30, Last : 80	ArrayList: [30, 20, 40, 50, 10, 80] First : 30, Last : 80	✓
✓	2	4 5 15 25 35	ArrayList: [5, 15, 25, 35] First : 5, Last : 35	ArrayList: [5, 15, 25, 35] First : 5, Last : 35	✓

Question 2

Correct

Marked out of 1.00

The given Java program is based on the ArrayList methods and its usage. The Java program is partially filled. Your task is to fill in the incomplete statements to get the desired output.

```
list.set();
list.indexOf();
list.lastIndexOf()
list.contains()
list.size();
list.add();
list.remove();
```

The above methods are used for the below Java program.

Answer: (penalty regime: 0 %)

[Reset answer](#)

```
1 import java.util.ArrayList;
2 import java.util.Scanner;
3
4 public class Prog {
5
6     public static void main(String[] args)
7     {
8         Scanner sc= new Scanner(System.in);
9         int n = sc.nextInt();
10
11        ArrayList<Integer> list = new ArrayList<Integer>();
12
13        for(int i = 0; i<n;i++)
14            list.add(sc.nextInt());
15
16        // printing initial value ArrayList
17        System.out.println("ArrayList: " + list);
18
19        //Replacing the element at index 1 with 100
20        list.set(1,100);
21
22
23        //Getting the index of first occurrence of 100
24        System.out.println("Index of 100 = "+list.indexOf(100) );
25
26        //Getting the index of last occurrence of 100
27        System.out.println("LastIndex of 100 = "+ list.lastIndexOf(100) );
28        // Check whether 200 is in the list or not
29        System.out.println(list.contains(200) ); //Output : false
30        // Print ArrayList size
31        System.out.println("Size Of ArrayList = "+ list.size() );
32        //Inserting 500 at index 1
33        list.add(1,500); // code here
34        //Removing an element from position 3
35        list.remove(3); // code here
36        System.out.print("ArrayList: " + list);
37    }
38 }
```

	Test	Input	Expected	Got

Question 1

Correct

Marked out of 1.00

Java HashSet class implements the Set interface, backed by a hash table which is actually a [HashMap](#) instance.

No guarantee is made as to the iteration order of the hash sets which means that the class does not guarantee the constant order of elements over time.

This class permits the null element.

The class also offers constant time performance for the basic operations like add, remove, contains, and size assuming the hash function disperses the elements properly among the buckets.

Java HashSet Features

A few important features of HashSet are mentioned below:

- Implements [Set Interface](#).
- The underlying data structure for HashSet is [Hashtable](#).
- As it implements the Set Interface, duplicate values are not allowed.
- Objects that you insert in HashSet are not guaranteed to be inserted in the same order. Objects are inserted based on their hash code.
- NULL elements are allowed in HashSet.
- HashSet also implements **Serializable** and **Cloneable** interfaces.

public class HashSet<E> extends AbstractSet<E> implements Set<E>, Cloneable, Serializable
Sample Input and Output:

5

90

56

45

78

25

78

Sample Output:

78 was found in the set.

Sample Input and output:

3

2

7

9

5

Sample Input and output:

5 was not found in the set.

Answer: (penalty regime: 0 %)

[Reset answer](#)

```

1 import java.util.HashSet;
2 import java.util.Scanner;
3 class prog
4 {
5     public static void main(String[] args)

Question 1

Correct

Marked out of 5.00

You are provided with a string which has a sequence of 1's and 0's.

This sequence is the encoded version of a English word. You are supposed write a program to decode the provided string and find the original word.

Each alphabet is represented by a sequence of 0s.

This is as mentioned below:

Z: 0

Y:00

x · 000

W : 0000

V: 00000

U:000000

T : 00000000

and so on upto A having 26 0's (000000000000000000000000000000).

The sequence of 0's in the encoded form are separated by a single 1 which helps to distinguish between 2 letters.

Example 1:

input1: 010010001

The decoded string (original word) will be: ZYX

Example 2:

The decoded string (original word) will be: WIPRO

Note: The decoded string must always be in UPPER case.

For example:

Answer: (penalty regime: 0 %)

```
1 import java.util.Scanner;
2 public class BinaryStringDecoder
3 {
4     public static void main(String[] args)
5     {
6         Scanner scanner = new Scanner(System.in);
7         String encodedString = scanner.nextLine();
8         String[] parts = encodedString.split("1");
9         StringBuilder decodedString = new StringBuilder();
10        for (String part : parts) {
11            int zeroCount = part.length();
12            if (zeroCount >= 1 && zeroCount <= 26) {
13                char decodedChar = (char) ('Z' - zeroCount + 1);
14                decodedString.append(decodedChar);
15            }
16        }
17        System.out.println(decodedString.toString());
18    }
19 }
```

Question 2

Correct

Marked out of 5.00

Given two char arrays `input1[]` and `input2[]` containing only lower case alphabets, extracts the alphabets which are present in both arrays (common alphabets).

Get the ASCII values of all the extracted alphabets.

Calculate sum of those ASCII values. Lets call it `sum1` and calculate single digit sum of `sum1`, i.e., keep adding the digits of `sum1` until you arrive at a single digit.

Return that single digit as output.

Note:

1. Array size ranges from 1 to 10.
2. All the array elements are lower case alphabets.
3. Atleast one common alphabet will be found in the arrays.

Example 1:

`input1: {'a', 'b', 'c'}`

`input2: {'b', 'c'}`

`output: 8`

Explanation:

'b' and 'c' are present in both the arrays.

ASCII value of 'b' is 98 and 'c' is 99.

$$98 + 99 = 197$$

$$1 + 9 + 7 = 17$$

$$1 + 7 = 8$$

For example:

Input	Result
a b c	8
b c	

Answer: (penalty regime: 0 %)

```

1 import java.util.Scanner;
2 public class ArrayCommonElementSum {
3     public static void main(String[] args) {
4         Scanner scanner = new Scanner(System.in);
5         String[] array1 = scanner.nextLine().split(" ");
6         String[] array2 = scanner.nextLine().split(" ");
7         int asciiSum = 0;
8         for (String element : array2) {
9             for (String elem1 : array1) {
10                 if (element.equals(elem1)) {
11                     asciiSum += element.charAt(0);
12                     break;
13                 }
14             }
15         }
16         int singleDigitSum = asciiSum % 9;
17         if (singleDigitSum == 0 && asciiSum > 0) {
18             singleDigitSum = 9;
19         }
20         System.out.println(singleDigitSum);
21     }
22 }
```

zz | j

	Input	Expected	Got	
✓	a b c b c	8	8	✓

Passed all tests! ✓

/

Question 3

Correct

Marked out of 5.00

Write a function that takes an input String (sentence) and generates a new String (modified sentence) by reversing the words in the original String, maintaining the words position.

In addition, the function should be able to control the reversing of the case (upper or lowercase) based on a case_option parameter, as follows:

If case_option = 0, normal reversal of words i.e., if the original sentence is "Wipro TechNologies BangaLore", the new reversed sentence should be "orpiW seigoloNhceT eroLagnaB".

If case_option = 1, reversal of words with retaining position's case i.e., if the original sentence is "Wipro TechNologies BangaLore", the new reversed sentence should be "Orpiw SeigOlhoncet Erolagnab".

Note that positions 1, 7, 11, 20 and 25 in the original string are uppercase W, T, N, B and L.

Similarly, positions 1, 7, 11, 20 and 25 in the new string are uppercase O, S, O, E and G.

NOTE:

1. Only space character should be treated as the word separator i.e., "Hello World" should be treated as two separate words, "Hello" and "World". However, "Hello,World", "Hello;World", "Hello-World" or "Hello/World" should be considered as a single word.

2. Non-alphabetic characters in the String should not be subjected to case changes. For example, if case option = 1 and the original sentence is "Wipro TechNologies, Bangalore" the new reversed sentence should be "Orpiw ,seiGolonhceT Erolagnab". Note that comma has been treated as part of the word "Technologies," and when comma had to take the position of uppercase T it remained as a comma and uppercase T took the position of comma. However, the words "Wipro and Bangalore" have changed to "Orpiw" and "Erolagnab".

3. Kindly ensure that no extra (additional) space characters are embedded within the resultant reversed String.

Examples:

S. No.	input1	input2	output
1	Wipro Technologies Bangalore	0	orpiW seigolonhceT eroLagnaB
2	Wipro Technologies, Bangalore	0	orpiW ,seigolonhceT eroLagnaB
3	Wipro Technologies Bangalore	1	Orpiw Seigolonhct Erolagnab
4	Wipro Technologies, Bangalore	1	Orpiw ,seigolonhceT Erolagnab

For example:

Input	Result
Wipro Technologies Bangalore 0	orpiW seigolonhceT eroLagnaB
Wipro Technologies, Bangalore 0	orpiW ,seigolonhceT eroLagnaB
Wipro Technologies Bangalore 1	Orpiw Seigolonhct Erolagnab
Wipro Technologies, Bangalore 1	Orpiw ,seigolonhceT Erolagnab

Answer: (penalty regime: 0 %)

```

1 import java.util.Scanner;
2 public class WordReversal
3 {
4     public static String reverseWords(String sentence, int caseOption) {
5         String[] words = sentence.split(" ");

ABSTRACT

The Library Management System (LMS) is an efficient tool designed to simplify the management of library resources for both users and administrators. The LMS allows users to view, borrow, and return books, while providing administrators with a special interface to manage the library catalog. Key features include user login, real-time updates on book availability, tracking borrowed books, and administrative functions for adding and managing books. The system is supported by a robust relational database, ensuring efficient data storage, retrieval, and management. SQL is used for all database operations to maintain data integrity and consistency. The LMS offers a straightforward and user-friendly interface developed with Java Swing/AWT, making it easy for everyone to use.

INTRODUCTION

1.1) INTRODUCTION

This project is a comprehensive desktop application developed for library management, designed to streamline the process of borrowing and returning books. Built using Java with Swing/AWT for the graphical interface and JDBC for database connectivity, the application ensures efficient management of library resources. The backend utilizes a robust MySQL database to handle data storage and retrieval, with SQL ensuring data integrity and consistency. Users can log in, browse the available books, and make reservations. Administrators have special access to add new books and manage the library catalog. The application features real-time updates on book availability, user-friendly interfaces, and confirmation notifications for successful transactions, providing an efficient and seamless user experience.

1.2) OBJECTIVES

The objective of this project is to develop a desktop-based Library Management System tailored for efficient management of library resources and enhanced user experience. Using Java with Swing/AWT, the system aims to provide a seamless process for users to borrow and return books, submitting essential details such as their name and contact information. Administrative functionalities are integrated to allow for effective oversight and management of book data. Leveraging MySQL as the backend database ensures robust data storage and scalability. The application's user interface prioritizes intuitive navigation and interaction, while a confirmation mechanism provides users with immediate feedback on the successful completion of their transactions. Ultimately, the project endeavors to modernize and optimize library management, fostering efficiency, transparency, and user satisfaction within the library system.

1.3) MODULES

User Authentication Module:

Manages user login and authentication. This module includes the setup for login screens, user validation, and session management to ensure secure access for users and administrators.

Database Connection Module:

Establishes a connection to the MySQL database using JDBC. This module handles database configuration, connection pooling, and error handling to ensure reliable database operations.

Book Schema Module:

Defines the structure for storing book data in the MySQL database. This module includes fields like book title, author, ISBN, availability status, and other relevant details.

User Interface Module:

Incorporates Java Swing/AWT components for rendering the graphical user interface of the application. This module provides the frontend components for user interactions, including login forms, book listing, borrowing, and returning books.

Book Management Module:

Manages the logic for adding, updating, and deleting book records in the database. This module includes the administrative functionalities for maintaining the library catalog, ensuring up-to-date book information.

Admin Interface Module:

Provides the administrative interface for managing library operations. This module includes screens and functionalities for administrators to oversee user accounts, manage books, and view borrowing activities.

1.4) SOFTWARE REQUIREMENT

The Library Management System (LMS) is a desktop application designed to streamline and enhance the management of library resources. Users can access the system to borrow and return books, providing details such as their name and contact information. Administrators have access to additional functionalities, including the ability to add, edit, and manage book data through an administrative interface. The system prioritizes user experience by offering intuitive forms, responsive design, and informative feedback messages. Security measures such as user authentication and data validation are implemented to ensure the confidentiality and integrity of user data. Built using Java with Swing/AWT for the interface and JDBC for database connectivity, with MySQL as the backend, the LMS aims to provide a reliable, scalable, and user-friendly solution for efficient library management.

SURVEY OF TECHNOLOGIES

2.1) SOFTWARE DESCRIPTION

The Library Management System (LMS) is a comprehensive desktop application meticulously crafted to streamline and enhance the management of library resources. Tailored for libraries within educational institutions or organizations, the LMS employs Java with Swing/AWT for its graphical user interface, ensuring a smooth and intuitive user experience. JDBC serves as the bridge for seamless connectivity to the database, facilitating efficient data management and retrieval. the LMS incorporates user authentication and authorization features to ensure secure access and protect sensitive library data from unauthorized access or manipulation.

2.2) LANGUAGES

- Java
- SQL (Structured Query Language)
- JDBC
- Java Swing/AWT

REQUIREMENT AND ANALYSIS

3.1) REQUIREMENT SPECIFICATION

The Library Management System (LMS) is an essential tool tailored for educational institutions and organizations to efficiently manage their library resources. The system encompasses a variety of functionalities aimed at providing a seamless experience for both users and administrators. The LMS shall allow users to register by providing necessary details including name, email, contact number, and password. Registered users shall have the ability to securely log in to their accounts to access library services and resources. The system shall facilitate administrators to add, edit, and delete book records, including details such as title, author, genre, ISBN, availability status, and location within the library. The LMS shall support the borrowing and returning process, allowing users to borrow books for a specified duration and return them within the designated timeframe. Users shall be notified of upcoming due dates and overdue books to ensure timely returns and prevent fines or penalties. The LMS shall implement robust security measures to protect user data and ensure confidentiality. Administrators shall have access to a comprehensive dashboard for managing user accounts, monitoring borrowing activities, and overseeing library operations. The dashboard shall provide functionalities for generating reports, tracking inventory, and analyzing library usage statistics. The LMS shall be scalable to accommodate growing library collections and increasing user demand over time.

3.2)

HARDWARE AND SOFTWARE REQUIREMENT

Hardware Requirement

- Processor: Intel Core i5 or higher
- RAM: 8 GB or more
- Storage: 500 GB SSD
- Network: High-speed internet

Software Requirement

- Operating System: Windows 10, macOS Catalina, or Ubuntu 20.04 LTS
- Java Development Kit (JDK): JDK 8 or later
- Database: MySQL 8.0, PostgreSQL 13.0, or similar relational database management system (RDBMS)
- JDBC Driver: MySQL Connector/J, PostgreSQL JDBC Driver, or equivalent for database connectivity

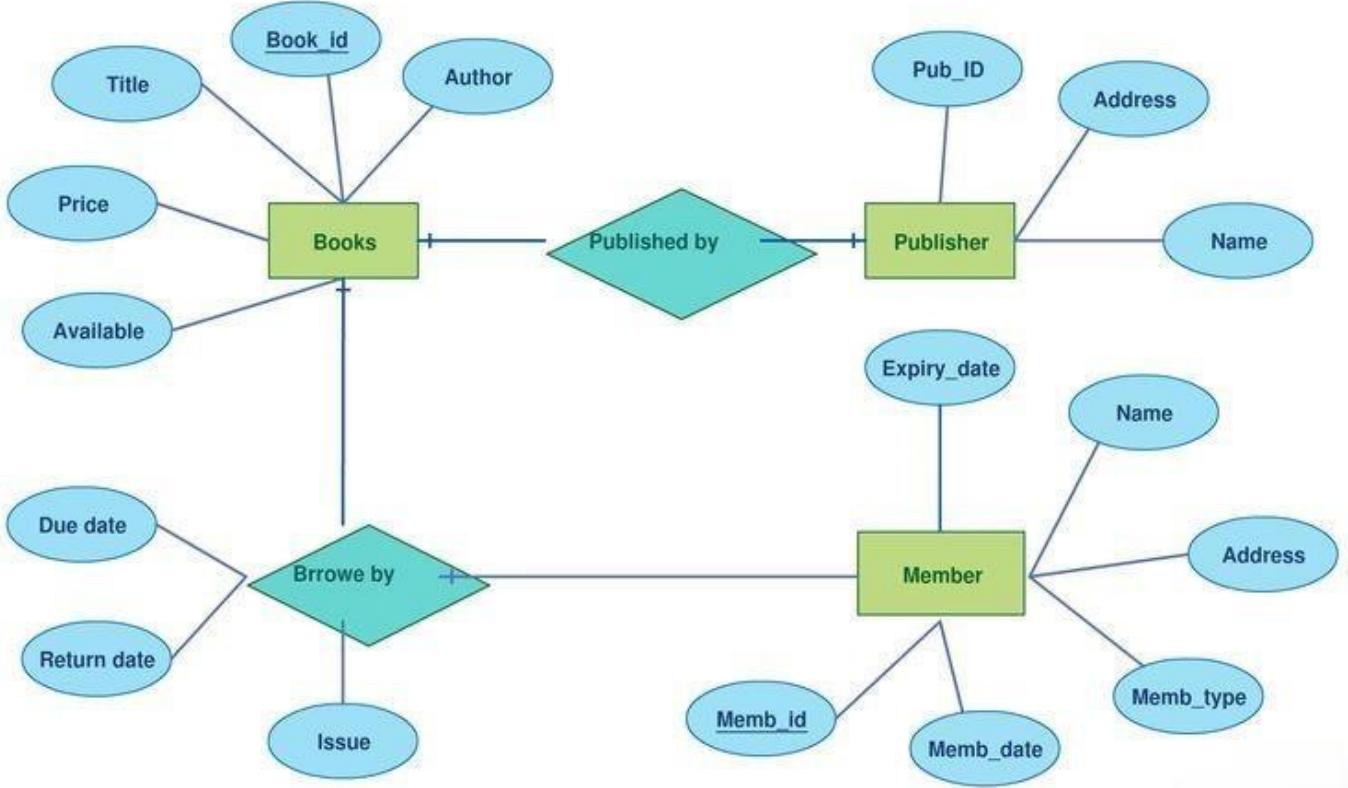

Development Tools

- IDE: Visual Studio Code, Eclipse, IntelliJ IDEA or similar
- Version Control: Git (GitHub or GitLab)
- Frameworks/Libraries: React.js, Angular.js (front-end); Django, Express.js, Laravel (back-end)
- Other Tools: Postman (API testing), Docker (containerization), Selenium (testing)

3.3)

ER DIAGRAM

E-R Diagram for Library Management System

3.4)

NORMALIZATION

Normalization is a critical aspect of database design, essential for optimizing data organization, reducing redundancy, and ensuring data integrity. Here's how the normalization process would look for the Library Management System.

1. First Normal Form (1NF)

Ensure atomicity by making sure that each table has a primary key, and each column contains only atomic values.

Initial Unnormalized Table:

isbn	title	author	genre	language	user_id	b_id
9780124077263	Computer Organization and Design	David A. Patterson, ...	Non-fictional	English	1	9780124077263
9780078022159	Database System Concepts	Abraham Silberschatz	Non-fictional	English	2	9780078022159

First Normal Form (1NF)

Split into multiple tables to ensure atomicity:

User Table:

	user_id	username
▶	0	admin
	1	student1
	2	student2
	3	student3
	4	student4
	5	student5

Book Table:

	isbn	title	author	genre	language
▶	9780078022159	Database System Concepts	Abraham Silberschatz	Non-fictional	English
	9780124077263	Computer Organization and Design	David A. Patterson, John L. Hennessy	Non-fictional	English
	9780156027328	Life of Pi	Yann Martel	Fictional	English
	9780486275598	Treasure Island	Robert Louis Stevenson	Fictional	English
	9780590353427	Harry Potter	J. K. Rowling	Fictional	English

Issued books Table:

	user_id	b_id
▶	1	9780124077263
	2	9780078022159

Second Normal Form (2NF)

Remove partial dependencies. No partial dependencies exist, so no changes needed.

Third Normal Form (3NF)

Remove transitive dependencies. No transitive dependencies exist, so no changes needed.

Final Database Schema User

Table:

	user_id	username
▶	0	admin
	1	student1
	2	student2
	3	student3
	4	student4
	5	student5

Book Table:

	isbn	title	author	genre	language
▶	9780078022159	Database System Concepts	Abraham Silberschatz	Non-fictional	English
	9780124077263	Computer Organization and Design	David A. Patterson, John L. Hennessy	Non-fictional	English
	9780156027328	Life of Pi	Yann Martel	Fictional	English
	9780486275598	Treasure Island	Robert Louis Stevenson	Fictional	English
	9780590353427	Harry Potter	J. K. Rowling	Fictional	English

Issued books Table:

	user_id	b_id
▶	1	9780124077263
	2	9780078022159

This normalized schema ensures data integrity, reduces redundancy, and improves efficiency in the Library Management System.

4) PROGRAM CODE

App.java

```
import java.sql.*; public  
class App {  
    public static void main(String[] args) throws Exception {  
        Connection connection = Connections.getConnection();      if(  
        connection != null) {  
            System.out.println("Connected to the database");  
            new Login();  
        } else {  
            System.out.println("Failed to connect to the database");  
        }  
    }  
}
```

Connections.java

```
import  
java.sql.DriverManager; import  
java.sql.SQLException; public  
class Connections {  
    public static java.sql.Connection getConnection() {  
        String url = "jdbc:mysql://localhost:3306/library_management_system";  
        String user = "root";  
        String password = "root";
```

```
try {
    return DriverManager.getConnection(url, user, password);
} catch (SQLException e) {
    e.printStackTrace();
}
return null;
}
```

```
Login.java import javax.swing.*;
import java.awt.*; import
java.awt.event.ActionEvent; import
java.awt.event.ActionListener;
```

```
public class Login extends JFrame implements ActionListener {
    JTextField username = new JTextField();
    JPasswordField password = new JPasswordField();
    JButton login = new JButton("LOGIN");
    JButton reset = new JButton("RESET");    public
Login() {
    // Set the font for all components
    Font font = new Font("Tahoma", Font.PLAIN, 14);
    UIManager.put("Label.font", font);
    UIManager.put("TextField.font", font);
    UIManager.put("PasswordField.font", font);
    UIManager.put("Button.font", font);
```

```
// Set the foreground color for all components to white
UIManager.put("Label.foreground", Color.WHITE);
UIManager.put("PasswordField.foreground", Color.WHITE);

// Label "Library Management System"
JLabel label = new JLabel("Library Management System");
label.setBounds((500 - label.getPreferredSize().width) / 2-30, 30, 300, 25);
this.add(label);

// Label "Welcome to the Library"
JLabel label2 = new JLabel("Welcome to the Library");
label2.setBounds((500 - label.getPreferredSize().width) / 2-15, 70, 200, 25);
this.add(label2);

// Label "Login to continue"
JLabel label3 = new JLabel("Login to continue");
label3.setBounds((500 - label.getPreferredSize().width) / 2-5, 110, 200, 25);
this.add(label3);

JLabel userLabel = new JLabel("Username:");
userLabel.setBounds(50, 160, 100, 25);

JLabel passwordLabel = new JLabel("Password:");
passwordLabel.setBounds(50, 200, 100, 25);

username.setBounds(150, 160, 200, 25);
```

```
password.setBounds(150, 200, 200, 25);

login.addActionListener(this);
login.setBounds(100, 250, 100, 30);

6) RESULT AND DISCUSSION

The developed Library Management System (LMS) adeptly fulfills its primary objectives of efficiently managing library resources and user interactions. The ER diagram meticulously captures the intricate relationships between books, users, transactions, and library inventory. The incorporation of user registration, borrowing, and returning functionalities ensures comprehensive library management. Moreover, the system's scalability is evident through its inclusion of features like transactional details and inventory tracking. This mini project lays a sturdy foundation for future enhancements, including real-time updates, an intuitive user interface, and robust reporting capabilities, poised to revolutionize library operations and enhance user satisfaction significantly.

7) CONCLUSION:

In conclusion, this mini project signifies the successful creation of a fundamental Library Management System (LMS). The devised ER diagram establishes a robust framework for efficiently managing library resources, user interactions, and transactional details. With ample scope for future enhancements, such as real-time updates, an intuitive user interface, and comprehensive reporting capabilities, this project lays the groundwork for a comprehensive library management solution poised to streamline operations and enhance user experience effectively.

REFERENCES

- 1)** Database System Concepts by Abraham Silberschatz, Henry F. Korth, and S. Sudarshan: This classic textbook provides a comprehensive foundation for database systems. It covers relational model theory, database design principles, query languages (SQL), and transaction management. While not specifically focused on miniprojects, it offers valuable knowledge for building your project.
- 2)** SQL in 10 Minutes, Sams Teach Yourself by Ben Forta: This beginnerfriendly book offers a quick introduction to SQL, the essential language for interacting with relational databases. It can equip you with the basic skills to build and manage your mini project's database structure.
- 3)** Database Design for Mere Mortals by Michael J. Hernandez: This book focuses on practical database design techniques that can be applied to real-world scenarios. It guides you through the process of creating logical and efficient database structures, which is crucial for a successful mini project.
